

# Chapter 2

## Impact of Political Strikes on Education

To address the question of interest, we wanted to exploit school-level data of exam participation and success in the national board examinations for various years collected from Board of Education and Bangladesh Bureau of Educational Information and Statistics (BANBEIS) (which are Primary School Certification (PSC), Junior School Certification (JSC), Secondary School Certification (SSC) and Higher Secondary School Certification (HSC) conducted by various examination boards in Bangladesh). In early 2015, starting from 5th January to end of March, Bangladesh went through an unprecedented political turmoil,<sup>1</sup> with repeated strikes and country-wide blockade for about three consecutive months which tremendously affected the preparation for public examination of the students. Employing school-level data and difference-in-difference set-up, this analysis will document the impact of such a long-standing political disorder and uncertainty on education and human capital in Bangladesh.

BANBEIS conducts yearly national census on schools to collect a rich set of educational information (see attached annex to see a recent questionnaire of BANBEIS census questionnaire). School level yearly data on student attendance, graduation, repetition, and exam-performance is available from BANBEIS by grade, gender, and geographic location since 1999. In addition, data on school characteristics including sanitation, drinking water quality, electricity, internet access, and teacher quality etc. are also collected. As secondary data, this additional complementary study will exploit school-grade level information on education outcomes from BANBEIS database. We wanted to focus on three grade specific educational outcome measures :(a) average absenteeism rate, i.e., number of days an average student in a grade remain absent the school, (b) average enrollment rate, and (c) graduation and repetition rate.<sup>2</sup>

Our empirical design was planned to follow school level panel framework. Note that not all

---

<sup>1</sup> [https://en.wikipedia.org/wiki/2015\\_Bangladeshi\\_political\\_crisis](https://en.wikipedia.org/wiki/2015_Bangladeshi_political_crisis)

<sup>2</sup> BANBEIS database maintains education database for each of the grade from six to ten.

grade-cohorts in a school are exposed to '*harta*' at the same frequency. Similarly, there exists geographical variation of the intensity of '*harta*'. We will exploit this arguably exogenous variation in the intensity of '*harta*' across grade-cohorts within a school to identify the impact of '*harta*' on schooling outcomes. The school fixed-effect framework will offer a valid result if the assumption that the unobserved part of the school-grade outcome is not correlated with the frequency of '*harta*'. Given the yearly data structure from BANBEIS, this empirical design does not allow controlling for temporal confounding factors including time-variant effects in the model. However, we are able to control for several regional level economic factors, such as, income, poverty, and literacy rate to control for some, in not all, time varying factors.

Formally, the following specification will be estimated for our outcome of interest  $Y_{gjt}$  in grade-level "g", in school "j", in the year "t" in region k.

$$Y_{gjtk} = \alpha_0 X_{jt} + \alpha_1 H_{tk} + \mu_{gj} + \gamma_t + \theta_k + \varepsilon_{gjtk},$$

where  $H_{tk}$  indicates number of hartal days in year "t" in region "k",  $X_{jt}$  is a vector of school-specific time varying observed characteristics,  $\mu_{gj}$  are grade and school-specific fixed effects,  $\gamma_t$  are year fixed effect. The main coefficient of interest in the above specification is  $\alpha_1$ , impact of a 'hartal' on outcome of interest.

Estimates obtained employing the above laid-out empirical design will not establish the causal impact of '*harta*' on education outcomes if there are unaccounted time-varying grade-specific factors within a school. For example, difficulty level of final exams may vary across cohorts due to non-standard questions or change in syllabus, or a change in quality of teachers. To overcome such bias in estimates, we will survey a nationally representative sample of schools to collect students' daily attendance data by grade-level (Grade VI-Grade X) assuming funds are available. The enumerators will collect grade specific daily attendance rate from schools for a certain number of years.

Intensity of '*harta*' across the geographic region is not similar since the metropolitan cities,

broadly speaking, the urban areas of the country, mainly bear the burden of '*harta*'. It is expected that schools from urban areas and cities will be affected more compared to schools in rural areas. Formally to capture this we will also run a variant of our specification, which is the following

$$Y_{gjtk} = \alpha_0 X_{jt} + \alpha_1 H_{tk} + \alpha_2 H_{tk} * Urban + \mu_{gj} + \gamma_t + \theta_k + \varepsilon_{gjt}$$

In our framework,  $\alpha_2$ , will give the differential impact of '*harta*' in the urban areas. Again, parents may consider daughters more vulnerable to casualty due to '*harta*' compared to their sons. To address such issue, we will estimate another variant of the above regression estimating heterogeneous impact on male and female students. Finally,  $\varepsilon_{gjt}$  is mean zero error term. Due to serial and spatial correlation in  $\varepsilon_{gjt}$ , standard errors will be clustered at the school-grade level.

**Problem faced during the data collection:**

We changed the focus away from the educational impact *harta* due to the data collection limitation and time required to do the analysis within the next fiscal year. This has been already reflected in the second years proposal of this project, which is approved. This data collection limitation partly caused by the recent security concerns in Bangladesh and partly difficulties in accessing the secondary data-set from the appropriate authority (BANBEIS).
